

# IPv6 Transition / Integration / Coexistence

(delete as appropriate)

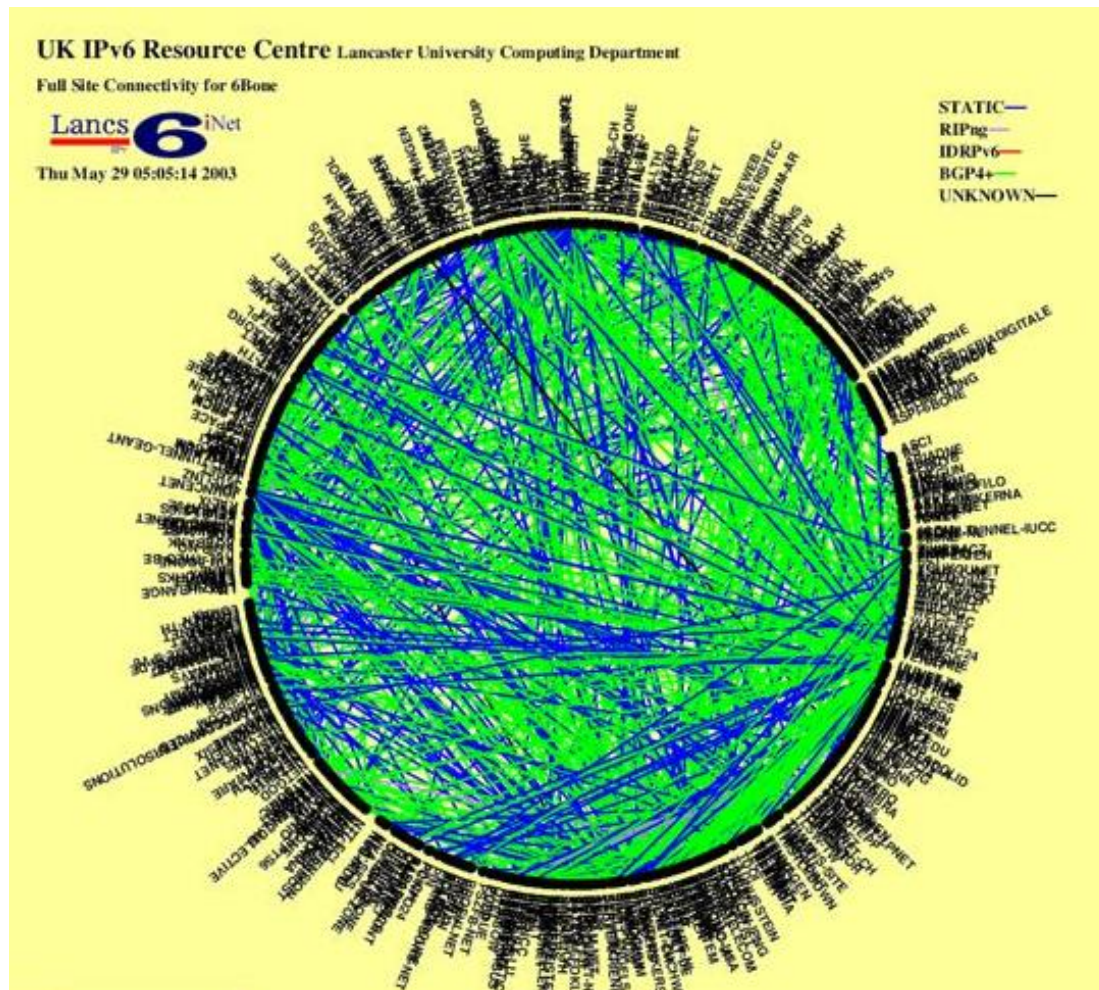

Tim Chown, Jisc  
*tim.chown@jisc.ac.uk*  
UK IPv6 Council Meeting  
Imperial College, 25 Sep 2018

# The original plan?

## Based on optimistic thinking in the 1990s...

- IPv4 is everywhere
- Let's introduce IPv6 alongside IPv4
- Then we can remove IPv4
- And do all that before the IPv4 address space runs out

# Early pain/gain – the 6bone years (from 1996)

A Gordian knot of IPv6-in-IPv4 tunnels, lacking routing policy.

More about just getting IPv6 working on early implementations.

Used IETF-managed 3ffe::/16 prefix before the RIRs did IPv6 allocations.

Visualisation by University of Lancaster.

# IETF ngtrans WG – designing transition tools

## Charter for Working Group

1. Specify the tools and mechanisms that might be used for transition to IPv6.
2. Write documents outlining how the various transition tools and mechanisms might apply to various scenarios for a transition to IPv6.
3. Coordinate with the IPv6 6bone testbed, operating under the IPv6 Testing Address Allocation allocated in Experimental RFC 2471, to foster the development, testing, and deployment of IPv6.
4. Coordinate appropriately with other IPv6 related IETF activities and activities in other organizations.

Clear need for more than just basic IPv6-in-IPv4 tunnels.

WG led to the proliferation of new IPv6 transition tools.

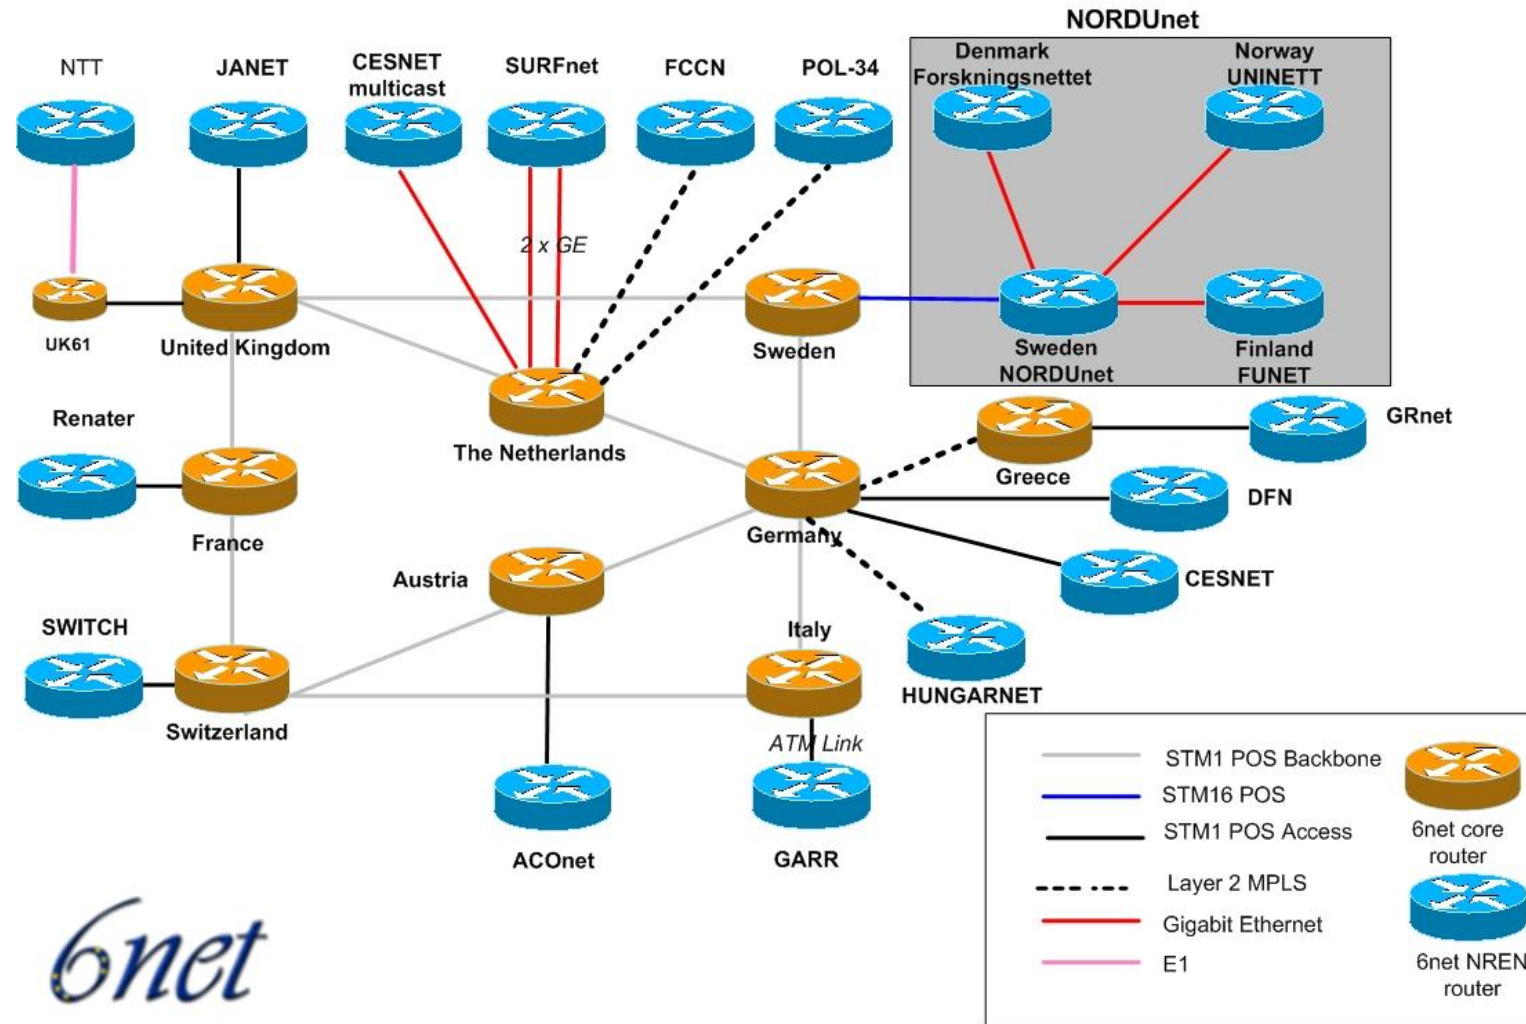

Lots of tools.

Really, LOTS!

ngtrans WG was shut down and replaced by v6ops WG.

# Native dual-stack backbones – 6net (2002-05)

National Research and Education Networks generally led the early dual-stack production backbone deployments.

The UK NREN, Janet, has been dual-stack in production for 15+ years.

CERNET2 went IPv6-only.

Campus deployment is another question!

# IPv4 runs out (at IANA) - Feb 2011

3 February 2011

<https://www.nro.net/ipv4-free-pool-depleted/>

## Free Pool of IPv4 Address Space Depleted

### IPv6 adoption at critical phase

**Montevideo, 3 February 2011** – The Number Resource Organization (NRO) announced today that the free pool of available IPv4 addresses is now fully depleted. On Monday, January 31, the Internet Assigned Numbers Authority (IANA) allocated two blocks of IPv4 address space to APNIC, the Regional Internet Registry (RIR) for the Asia Pacific region, which triggered a global policy to allocate the remaining IANA pool equally between the five RIRs. Today IANA allocated those blocks. This means that there are no longer any IPv4 addresses available for allocation from the IANA to the five RIRs.

IANA assigns IPv4 addresses to the RIRs in blocks that equate to 1/256th of the entire IPv4 address space. Each block is referred to as a "/8" or "slash-8". A global policy agreed on by all five RIR communities and ratified in 2009 by ICANN, the international body responsible for the IANA function, dictated that when the IANA IPv4 free pool reached five remaining /8 blocks, these blocks were to be simultaneously and equally distributed to the five RIRs.

"This is an historic day in the history of the Internet, and one we have been anticipating for quite some time," states Raúl Echeberría, Chairman of the Number Resource Organization (NRO), the official representative of the five RIRs. "The future of the Internet is in IPv6. All Internet stakeholders must now take definitive action to deploy IPv6."

IPv4 still works,  
but management  
and operations  
grow more complex;  
address trading,  
more NAT, use of  
CGN, etc.

# The World IPv6 Launch – June 2012

<http://www.worldipv6launch.org/>

W6L focused on IPv6-enabling public-facing content.

Facebook, Google, Akamai and others got on board.

Also encouraged ISPs to enable 1% of their users.

Today, Facebook uses IPv6 internally, while its public-facing services are dual-stack.

# IPv6-only to mobile handsets – Nov 2013

## T-Mobile Goes IPv6 Only on Android 4.4 Devices

by [whfsdude](#) 06:27PM Monday Nov 04 2013

T-Mobile and MetroPCS users with Android 4.4 KitKat will default to IPv6 only for connecting to the mobile network. The changes are present in Android code commit [4b3880d](#) which changed the default access point name (APN) protocol to IPv6. IPv4 connectivity will be provided by a transition mechanism known as 464XLAT.

T-Mobile's transition to IPv6 started in 2010 when they launched a [IPv6 friendly user trial \(beta\)](#). The friendly user trial used a technology called [DNS64/NAT64](#) which provided access to IPv4.

However, DNS64 does not work with IPv4 literals. The friendly user trial revealed lots of [breakage](#) with popular apps such as Skype and Netflix which use IPv4 literals in their applications.

To address the IPv4 literal problem with DNS64 and NAT64, T-Mobile's Cameron Byrne co-authored a new standard known as [464XLAT](#). 464XLAT calls for a [CLAT daemon](#) to provide local IPv4 connectivity to the smartphone.

# IPv6 on US mobile handsets - 2016

Over 50% of traffic to Facebook from big four US mobile operators was native IPv6 as of summer 2016

IPv6-only to the handset  
Simplicity for the operator  
EE has done the same in the UK

Today marks the first day that more people used IPv6 to access Facebook than IPv4 from the 4 major USA mobile networks. This is a huge milestone in just 4 short years since World IPv6 Launch in 2012.

# IPv6 - up and to the right - 2009 to today

## IPv6 Adoption

We are continuously measuring the availability of IPv6 connectivity among Google users. The graph shows the percentage of users that access Google over IPv6.

All the work before 2012 was important, but negligible IPv6 growth before 2012.

Doesn't show whether devices are in dual-stack or IPv6-only environments. Or mobile vs enterprise.

Growing desire to explore IPv6-only beyond just mobile. How realistic is this today?

<https://www.google.com/intl/en/ipv6/statistics.html>

# Wading in the sea of IETF transition tools...

6over4      6PE      464XLAT  
DSTM      ISATAP      LISP  
RFC 4213      Tunnel broker      MAP T/E  
Dual stack      GRE      LW4o6  
NAT-PT      6rd      DS Lite  
6to4      SIIT      dIVI      NAT64 / DNS64  
Teredo

There is no shortage of choice in transition tools.

Some older tools are still applicable, others not so.

The question is which tool(s) are appropriate for your own scenario. There is no grand plan.

That's what we'll be looking at and discussing today.

(Note: this is NOT a complete list!)
